

Performing your First RFID Scan

Riot Scan Training Guide

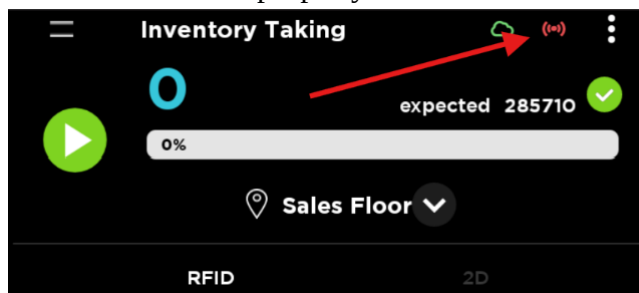

Open the Riot app.

If prompted by quick setup, or device configuration, please read [Scanner Provisioning article](#)

Ensure a stable internet connection for the device. The app has an indicator in the top-right corner that shows if the device is connected to Wi-Fi.

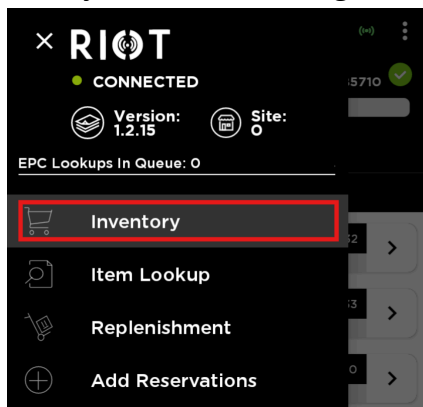

Connect the RFID reader to the Android device. A similar indicator icon as the above mentioned will confirm if the RFID reader is properly connected. If it is red, indicating no connection, make sure your scanner is charged.

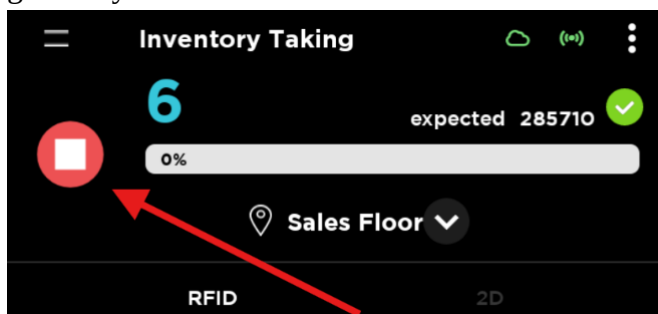

There are lights on the side of your scanner. Red: low charge. Green: fully charged. Yellow: charging. No light: No charge at all!

Once your scanner is charged and ready, open the "Inventory Taking" function within the app.

Begin scanning by pressing the play button. The scanner will beep as items are scanned. A slowing beep rate generally means most of the items in the area have been scanned.

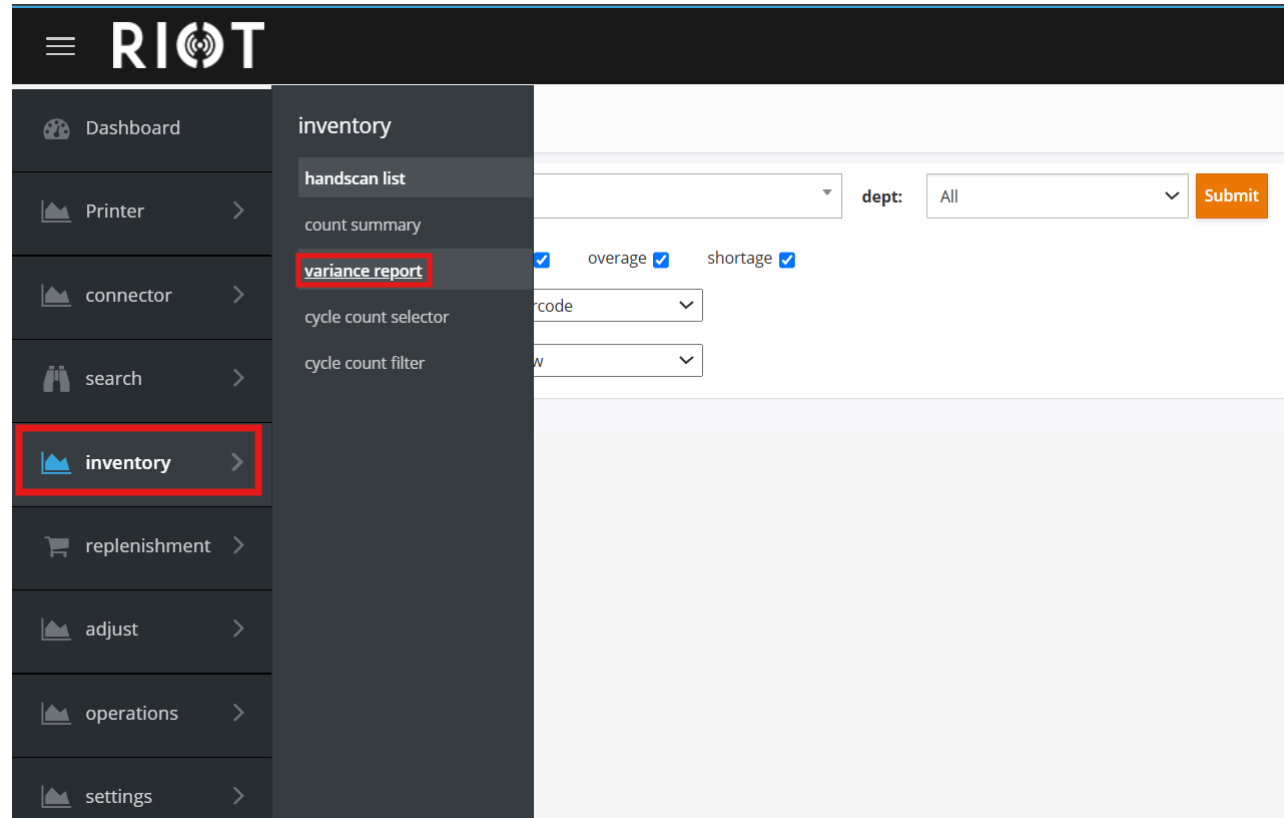

Submit the scan data by clicking the three dots in the top-right corner and selecting "Submit Hand Scan."

Name & Confirm the scan submission. Multiple scans from different devices will automatically combine into one report on the portal if they are submitted using the EXACT same name. We recommend that this is kept as the date by default.

If you need to reset your scan: Click the three dots in the top right and select 'Reset Stock Counters' to restart your scan.

Access the Riot portal from a computer and navigate to the "Inventory" section, then "Hand Scan List" to review the scans.

Proceed to the "Variance Report" section.

Select the store site ID.

Select count ID and submit.

Group the report by barcode, department, or style.

Review the variance report, which shows discrepancies between the scanned count and the expected count.

For more information the variance report on please read the "[Accessing your variance report](#)" article

Additional Notes:

The scanner can read tags through many materials like cardboard, plastic, and even thin walls in some cases, but metal surfaces will affect scan accuracy. An RFID tag completely blocked by metal will likely not scan

It is recommended to quickly fan items that are tightly packed together. For example; when scanning an aisle of shirts, fan through them with your other hand as you scan. Other smaller tightly packed items (like individual stickers in a box) will need even more attention.

The variance report can be exported to Excel for further analysis.

If you encounter an issue with the app when trying to scan, we recommend to first try closing the app by clicking the square on the bottom right of the device. This will bring up the multitasking window, and you can swipe away or “X” the RIOT app. Don’t worry if you were in the middle of a scan, you will be asked if you want to load your last scan when opening the app again.
